

Leverage vs endpoint, one point per network

analysis_units.csv, stratum flip_cov100_bw010, status == ok only; per-network leverage and endpoint are medians over that network's units; marker area $\propto \sqrt{n_{\text{units}}}$.

Take: per-network leverage k_{g0}/n_k against median endpoint, log-x; the leverage=1 line separates Meek-closed K from K that draws on more of the background knowledge.
