

Zero SHD is compatible with maximal fragility — $r_val=1$ predicted it, SHD did not

shd_truth=0 here means G0 IS the ground-truth DAG; the analyst's background knowledge is perfectly correct. The committed adjustment set still fails on the very first corrupted claim.

Marker area $\propto \sqrt{(\text{contributing instances})}$; stratum median restricted to $n_eval \geq 30$ per instance and $n \geq 5$ instances per depth. r_val carries Conjecture 2 (hence Anti-Exchange Case B, verified not proved); the error is one-sided, so radii can only be too large.
