

Radius out of sample: exact everywhere, and set by how much knowledge is imposed

Every one of the 831 radii is exact and finite:
0 UNREACHED (−1) sentinels, so nothing here is censored

Withdrawing knowledge lifts instances off $r = 1$
(69.8% $\rightarrow$ 34.0%) while the ceiling collapses (14 $\rightarrow$ 4)

831 admissible instances out of 115,974 ordered pairs screened; 115,143 pairs rejected before measurement,
chiefly 66,330 treatment_not_in_or_adjacent_to_component, 42,618 no_causal_path, 3,738 empty_set_trivially_valid.

3 censored per-network runs — pathfinder at coverage 1, 0.5, 0.25, each stopped at the 1200 s wall cap; the pairs those runs had not reached were never screened and are in no total above.
