

Per-network spread, stratum flip_cov100_bw010

analysis_per_network.csv; marker area $\propto \sqrt{n_{\text{units}}}$; grey bars are each network's own q1-q3 of AUC_frac_usable; verticals from analysis_tau.csv for the same stratum/endpoint. 1 network(s) contributed units to this stratum but had no usable endpoint at all (every unit censored) and are excluded from the dot plot.

Take: networks sorted by their own median; dot area is unit count, grey bars are within-network IQR, verticals contrast the corpus-pooled median against the average of per-network medians.
