

Median radius reads off the separation, never the component size — until missing background knowledge makes $|K_{G0}|$ the binding constraint

coverage 1.0 — diagonal in s , flat in $|component|$

coverage 0.5 — $|K_{G0}|$ now caps r , so rows bend

Grey = no design realised that $(s, |C|)$ pair; nothing is interpolated.
coverage 1.0: $n = 792$ of 792 rows | coverage 0.5: $n = 780$ of 792 rows; excluded: 12 rejected at generation
